secretariat@harascercy.fr

VACCINATIONS

Flu and EHV	Primary vaccination protocol with 2 injections spaced 21 to 60 days apart, followed by a booster every 6 months. If the vaccination schedule is interrupted : restart the protocol.

Equine Viral Arteritis (EVA)

Has to be made after 01/01/2027

Negative results by seroneutralization or ELISA

If result is positive:
2 positive seroneutralization results that are stable or declining at a minimum interval of 14 days
Tests to be carried out in the same laboratory

Contagious Equine Metritis (CEM)

Research Categories	**Contagious Equine Metritis** Taylorella equigenitalis Klebsiella pneumonae Pseudomonas aerugionosa	**General bacteriology of the cervix**
Barren / maiden	Swab to be done after 01/01/2027 on the sinus and/or clitoral fossa **+ on the cervix for mares that have aborted or slipped**	For mares covered in 2026 that remained empty or that have aborted
In foal / foal at foot	Swab to be done 30 days before the due date or after foaling on the sinus and/or clitoral fossa	

For mares coming from Italy: a negative dourine test will be required before the mare's arrival.

After two heats have been used without results, a uterine bacteriological test (for all germs) may be required before another mating. Any mare in poor health or showing obvious signs of ill health, uterine discharge, or dangerous behavior may be refused, at the discretion of the SCAECC.
